

Outlook Module

The Outlook Module allows a user to view, filter, and export at a message level, the content(s) of a Microsoft® .PST or .OST file without any conversion required. Powerful filtering options are available and include the ability to use inclusion or exclusion. Proper filtering at the point of collection will drastically limit the amount of data that actually needs to be further processed or reviewed.

- View folder structure of .PST or OST file
- View parent child relationship of messages and attachments
- View message detail
- Index and search emails and attachments
- Export only items identified for further processing or review

- Filter using Include or Exclude logic
- Filter items as a family group
- Filter by domain and email address
- Filter by size
- Filter by attachment type
- Filter by date
